

EECS 498 · AASE · FALL 2026

Build the agent

LAB03 · SEPTEMBER 28-29, 2026

Continue your assistant, design, and history.

Preserve the boundary snapshot

Keep the Apply submission in history.

Repair unfinished foundations with staff support.

Continue in the same repository; the submitted grade does not change.

Revise the control-flow design

The model can now request a tool.

Your program validates the call, obtains approval, and returns a result.

A stop condition bounds what happens next.

Extend your client, keep configuration

Extend your client as the API lessons introduce function calling.

Keep the configurable API base, model identifier, credentials, and limits.

No hard-coded Ollama dependency.

Prove that denial means no action

Use a fake model response requesting a tool. Deny the request.

Assert the tool did not execute, the target stayed unchanged, and the loop received the denial.

Then test a harmless approved operation in a disposable target.

Implement one bounded increment

Update the system spec and relevant diagrams.

Write an increment spec, choose Aider context, and implement with tests.

Keep Stage 1 edit protections while adding the new control path.

Leave with evidence

Capture a denied action from your implementation, or record the blocker with staff.

Update diagrams and name the next verifiable result.

Push the work and session evidence.
